

Couve Célia

Célia Couve is currently completing her bachelor's degree in Cognitive Neuroscience in the Department of Psychology at the University of Montreal, with a specialization in neuropsychology, under the supervision of Alexander Moreno, Ph.D. at the Innovation, Technology and Cognition laboratory (INTECOG). With the objective of pursuing her graduate studies, Célia is collaborating at the INTECOG Laboratory to understand the use of gerontechnology to promote aging at home in older adults living with minor neurocognitive disorders. Her main field of interest is normal and pathological aging and the use of therapies to help older people navigate the challenges experienced in this period of their lives. Because of her own experiences with close relatives living with major neurocognitive disorders, she understands the challenges that elders and their family members face everyday. She is motivated to contribute to the growing body of knowledge on Alzheimer and other related diseases in order to make meaningful discoveries that will impact the life of people afflicted with those conditions and the people caring for them.
