

## **Jones Peter**

Mental health and general nurse trained) works as a community mental health nurse, with 47 years experience in the NHS. Supervised by the University of Manchester, his B.A. (Hons.) dissertation in computing and philosophy, was entitled: 'Using a Semantic Network to Represent Nursing Terminology'. A combined interest in care processes and technology enhanced learning since the early 1980s is ongoing. As a practicing nurse, Peter adopts a psychosocial and holistic approach to person-centred care and utilises Hodges' model of care – a generic conceptual framework. Hodges' model, facilitates reflective practice and critical thinking with support for lifelong learning. Drawing on clinical experience and expertise, a theoretical basis for Hodges' model is sought. A web presence, and small bibliography are encouraging other researchers to discover and apply Hodges' model in their own respective disciplines. Peter believes Hodges' model, can help address the challenges of integrated care, information disorder, parity of esteem, the determinants of health, health literacy, global and planetary health, and the need for sustainable health systems. The new academic year brings the exciting and challenging prospect of part-time tutoring at the University of Bolton.
